# **Machine Translation**

Dan Klein UC Berkeley

1

Slides from John DeNero Translation Task

- Text is both the input and the output.
- Input and output have roughly the same information content.
- $\bullet$  Output is more predictable than a language modeling task.
- Lots of naturally occurring examples (but not much metadata).

### Variety in Human-Generated Translations

A small planet, whose is as big as could destroy a middle sized city, passed by the earth with a distance of 463 thousand kilometers. This was not found in advance. The astronomists got to know this incident 4 days later. This small planet is 50m in diameter. The astonomists are hard to find it for it comes from the direction of sun.

A volume enough to destroy a medium city small planet is big, flit earth within 463,000 kilometres of close however were not in advance discovered, astronomer just knew this matter after four days. This small planet diameter is about 50 metre, from the direction at sun, therefore astronomer very hard to discovers it.

Evaluation

BLEU score: geometric mean of 1-, 2-, 3-, and 4-gram precision vs. a reference, multiplied by brevity penalty (harshly penalizes translations shorter than the reference).  $\text{Matched}_i = \sum_{t_i} \min \left\{ C_h(t_i), \max_j C_j(t_i) \right\}_{\substack{\text{originates} \\ \text{only in a reference, then only the first is}}_{\substack{\text{originates} \\ \text{originates}}}$   $\text{Matched}_i \qquad \text{"Clipped"}_{\substack{\text{originates} \\ \text{originates}}}^{\text{"Clipped"}}$ 

## Human Evaluations

Direct assessment: adequacy & fluency

- Monolingual: Ask human-generated reference. (Easier to source annotators)
- $\bullet$  Bilingual: Ask humans to compare machine translation to the source sentence that was translated. (Compares to human quality)
- $\bullet$  Annotators can assess segments (sentences) or whole documents.
- \*Segments can be assessed with or without document context.

## Ranking assessment:

- •Raters are presented with 2 or more translations.
- •A human-generated reference may be provided, along with the source.
- "In a pairwise ranking experiment, human raters assessing adequacy and fluency show a stronger preference for human over machine translation when evaluating documents as compared to isolated sentences." (Laubli et al., 2018)

Editing assessment: How many edits required to reach human quality

Translationese and Evaluation

Translated text can: (Baker et al., 1993; Graham et al., 2019)

- be more explicit than the original source
- · be less ambiguous
- be simplified (lexical, syntactically and stylistically)
- display a preference for conventional grammaticality
- avoid repetition
- exaggerate target language features
- display features of the source language

"If we consider only original source text (i.e. not translated from another language, or translationese), then we find evidence showing that human parity has not been achieved." (Toral et al., 2018)

(Baker et al., 1981) Corpus linguistics and transla- tion studies: Implications and applicat (Graham et al., 2019) Translationese in Machine Translation Evaluation.

### WMT 2019 Evaluation

2019 segment-in-context direct assessment (Barrault et al, 2019):

- ✓ German to English: many systems are tied × English to Gujarati: all systems are outperwith human performance; × English to Gujarati: all systems are outperformed by the human translator;

- English to Finnish: all systems are outperformed by the human translator;

   English to Finnish: all systems are outperformed by the human translator;

   English to Russian: Facebook-FAIR as tied with human performance.

   English to Russian: Facebook-FAIR is tied with human performance.
- × English to Chinese: all systems are outper-formed by the human translator; Kenglish to Kazakh: all systems are outper-formed by the human translator;
- $\times$  English to Czech: all systems are outperformed by the human translator;  $$\times$$  English to Lithuanian: all systems are outperformed by the human translator;

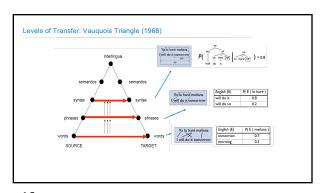

Statistical Machine Translation (1990 - 2015)

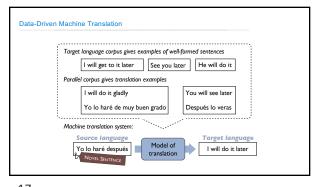

13 14

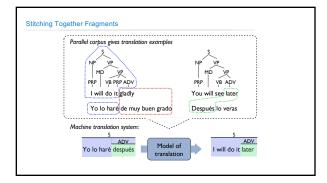

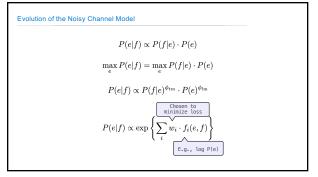

When I look at an article in Russian, I say: "This is really written in English, but it has been coded in some strange symbols. I will now proceed to decode."

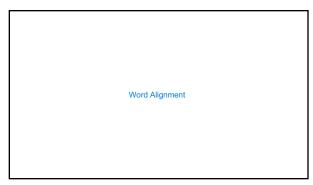

Warren Weaver (1949)
